

PROJECT DESCRIPTION - GROUP 11

Wandora

AI-assisted Group Trip Planning and Management Application

1. Team Members

No.	Member Name	Student ID
1	Lê Thanh Hải	23127360
2	Bùi Thế Anh	23127021
3	Đặng Nhật Minh	24127077
4	Nguyễn Hoài Đức	24127344

2. Introduction

Wandora is an AI-assisted group trip planning and management. The app helps users plan, organize, and manage trips more conveniently by combining generative AI with practical group travel tools. Users can create a trip, generate a personalized itinerary, manually add places and links, collaborate with members, prepare packing lists, track expenses, save bills, and split costs after the trip.

The idea is worthy to do because trip planning is usually not limited to choosing places to visit. In real group trips, users also need to decide what to bring, divide shared items, share the schedule, collect opinions from other members, record expenses, keep bill evidence, and calculate how much each person should pay. These tasks are often handled across many separate tools such as chat apps, notes, spreadsheets, maps, and banking apps, which makes the planning process fragmented and easy to confuse.

Wandora addresses this problem by providing one shared workspace for the whole trip. The AI helps users create and revise travel plans faster, but the user remains in control. Users can manually edit the itinerary, add their own destinations, attach Google Maps or reference links, enter trip details.

3. Target Users and Environments

3.1 Target Users

The main target users are people who plan trips with friends, classmates, partners, or family members and need a simple way to coordinate the plan and shared expenses.

User Group	Description	Main Needs	Reason to Target
Students	Users who often travel with friends and have limited budgets.	Affordable planning, expense tracking, packing checklist, and cost splitting.	They usually need practical tools but do not want a complicated system.
Young travelers	Users who enjoy short trips and want quick planning.	Fast itinerary generation, easy customization, and flexible schedule changes.	They are familiar with web apps and AI tools.
Small groups	Friends, couples, classmates, or families traveling together.	Shared itinerary, member roles, group checklist, and expense summary.	Group trips require collaboration and clear responsibilities.
First-time visitors	Users who are not familiar with a destination.	Suggestions for places, activities, and travel preparation.	They need a starting point and travel guidance.

Group organizers	Users responsible for planning trips for others.	Control over editing, task assignment, and expense management.	They need a central place to manage trip information.
------------------	--	--	---

3.2 Usage Environments

Wandora will be developed as a responsive web application.

Environment	Supported Platform
Web browser	Chrome, Edge, Safari, Firefox
Desktop / laptop	Windows, macOS
Phone/Tablet	Android, IOS

4. Key Features

No.	Feature	Description
1	Trip Creation and Preference Input	Users create a trip by entering destination, dates, group size, budget level, travel style, and interests. These inputs are used by the AI to generate a suitable plan.
2	AI Itinerary Generator	The system generates a day-by-day itinerary with suggested activities for morning, afternoon, and evening. Each activity can include a short description, estimated duration, and notes.
3	AI Itinerary Adjustment	Users can ask the AI to revise the plan using natural language, such as making it cheaper, more relaxing, more food-focused, or suitable for rainy weather.
4	Manual Places and External Links	Users can manually add places, activities, addresses, descriptions, estimated costs, notes, and external links (such as Google Maps, restaurant websites, booking pages, or review articles). Note: Places added manually or linked from external sources are treated as user-provided entries. AI itinerary generation does not use information from these external links or websites. If needed, please review and adjust the schedule or details for these places manually.
5	Group Collaboration	Users can invite members to join a trip workspace. Members can view the itinerary, checklist, notes, and expenses in one shared place.
6	Role and Permission Management	The trip owner can assign roles such as Owner, Editor, or Viewer to control who can edit the plan and who can only view information.
7	AI Packing Suggestions	The AI suggests items to bring based on destination, trip duration, travel style, weather forecasts, and planned activities. Users can edit the checklist manually.
8	Shared Luggage Planning	The app helps divide shared items among members, such as medicine, power bank, camera, sunscreen, or snacks, to avoid duplicated items.
9	Manual Place Note Input	Users can manually add notes to a place by entering text with any relevant information, such as reminders, recommendations, meeting points, expense tracking.
10	Place Ratings and Reviews	Users can rate each place using a rating score and optionally leave a review with comments. Reviews help document personal experiences and make it easier to revisit or share useful information.
11	Share or Export Trip Plan	Users can copy or export itinerary, checklist, and expense summary to share with other members or keep as a record.

The app does not include booking, payment, live hotel prices, flight search, or advanced route optimization. These excluded features can be considered future work.

5. User Interviews and Evidence

No.	Interviewee	Background / Occupation	Travel Habits	Interests / Characteristics	Evidence
1	Begi	Student	Travels 5–6 times per year. Usually plans trips by searching destinations, reading reviews, looking at photos, finding restaurants and hotels, and estimating the budget. Trip planning usually takes a lot of time.	Cares a lot about budget planning and often uses a shared group fund. Finds expense splitting difficult in group trips. Values destination voting, editable itineraries, real reviews, updated information, and checklist or packing suggestions. Interested in AI-generated itineraries but concerned about inaccurate or outdated information.	 Interview ...
2	Khánh	Student	- 1–2 times per year, usually with friends. - Searching on Google and Facebook. - Doesn't focus much on budget because trips are usually short.	- Group travel, values efficient trip planning, - Voting for destinations - AI-generated itineraries but concerned about the accuracy of location and pricing information.	 Interview ...
3	Ngô	Student	- 1 times per year, usually with family. - Rarely plans trips in advance - Not pay much attention to the budget.	- Simple and convenient travel planning. - AI-generated itineraries to make destination decisions faster when traveling with friends. - Concerns about potentially erroneous information of AI.	 Interview ...
4	My	Student	-3-4 times per year with family. - Prefers relaxing weekend trips	-Lazy, Nature-lover - Wanting a AI assistant for preparing trip tour	 Interview ...
5	Danny	Student	- 4-5 times a year - Goes with friends or family - Plans by social media and word of mouth	- Concerned about budget - Faces disagreement on trips	 Interview ...
6	Ambrose	Student	- Once every 1-2 years - Only with family - Simple office software to plan - Google to research	- Concerned about ethics of AI - Does not need voting but in favor of idea	 Interview ...
